

# The ONNA project

## The Project

The project aims at informing visitors about the historical buildings, the way of life... of Onna village (nearby L'Aquila) before the heartquake in 2009 through videos, photos and live interviews.

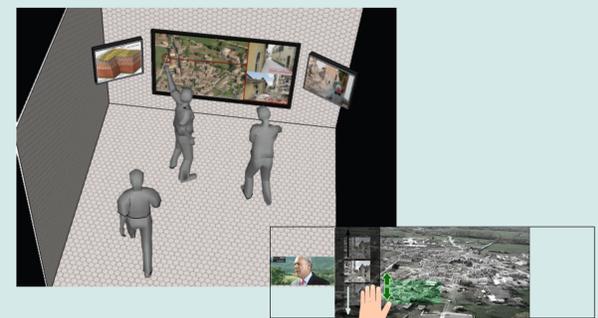

The system detects users' gestures like pointing at and sliding using an infra-red camera and appropriate computer vision software.

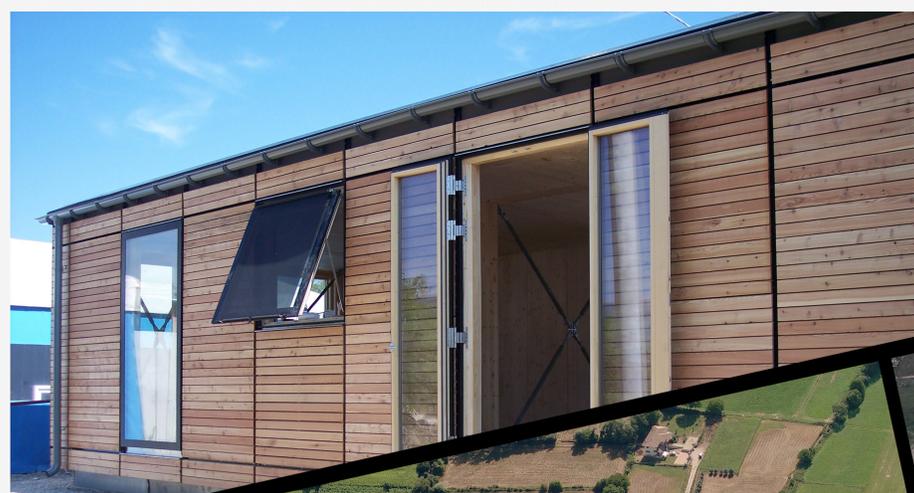

Advanced interactive technologies help to reduce the gap between user's behavior and use of Information Technology.

As the user indicates an area of the Onna map, the system displays the image of the area before the earthquake and presents a slideshow of images and related videos. The user can select a specific item and watch it on the companion screens.

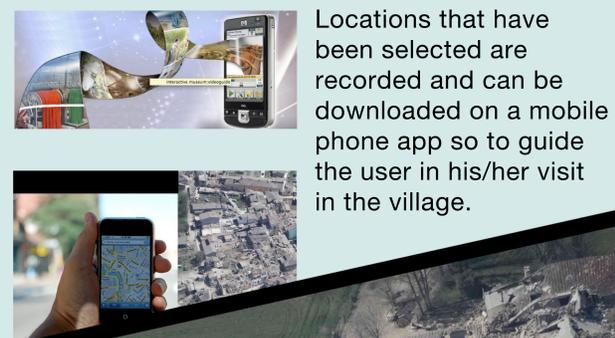

## The system

The system will be installed soon at Onna Infobox that has been set at Onna with the support of Germany government.

Videos has been recorded by RAI Italian Television.

Locations that have been selected are recorded and can be downloaded on a mobile phone app so to guide the user in his/her visit in the village.
